

ABSTRACT

A grip accessory, especially for a writing instrument such as for a convention pencil or pen, a cosmetics pencil or applicator, a medical instrument, or the like.

The device has a core with a bore made from a material that slides relatively easily over the instrument, an aperture in the core, and an elastomeric sheath with protrusions that extend through the aperture and into the bore. The protrusions provide resistance to the sliding of the instrument through the bore when the instrument's outer surface engages the protrusions, thereby keeping the grip accessory in place but allowing the accessory to be placed on and removed from the elongate instrument.
